Belgium

Subject: Application for the Data Scientist – GenAI position

Dear Artefact Belgium Recruitment Team,

I am applying for the **Data Scientist – GenAI** position because it closely matches the direction I have been taking over the past few years: from **Data Science and Machine Learning** towards building AI systems that can actually be integrated into real workflows.

What particularly caught my attention in this role was the emphasis on **agentic AI, tool calling and MCP**. These are not simply technologies I have been reading about; they are problems I have been actively exploring while building **Seshat**, my own agentic AI platform. Working on it has led me to think beyond the LLM itself: how agents access tools, retrieve knowledge, coordinate tasks, manage permissions, involve humans when necessary, and ultimately become reliable enough to support real business processes.

My experience at **Allianz France** gave me another perspective that I consider equally important. Working on the migration of an insurance datamart to **Python/PySpark** taught me that a technically interesting solution is not enough: **data quality, testing, non-regression and reliability** are essential when systems are expected to operate in a real organisation. This production mindset is something I now bring to the AI systems I build.

This is also why **Artefact** appeals to me. I am looking for an environment where Data Science, AI and engineering meet real business problems, and where I can learn from people who have already taken GenAI systems from experimentation to production. I would especially like to deepen my experience in areas such as **LLM evaluation, fine-tuning and large-scale GenAI deployment**, while contributing the hands-on experience I already have with **RAG, multi-agent systems and MCP**.

I recently graduated as a **Big Data & Data Science Engineer** and I see this position as a strong opportunity to build the next stage of my career around **Generative and Agentic AI**. I am currently based in the Paris area and am open to relocating to Brussels.

I would be glad to discuss my work, including Seshat, and learn more about the GenAI projects being developed by Artefact Belgium.

Kind regards,

Stéphane KPOVIESSI
